SANITIZED PUBLIC EXAMPLE

Old Escondido Mature Palm Documentation Example

A field-record example for preservation, monitoring, loss documentation, and broader-area implementation.

This public derivative omits private addresses, recipient information, correspondence, and parcel-level identifiers. It is not a municipal plan, formal tree-risk assessment, laboratory report, or City-endorsed document.

HOW TO READ THIS EXAMPLE

Purpose and Scope

This document demonstrates how San Diego Palm Protection can organize broader-area palm observations into a stable, repeatable record. It uses a limited Old Escondido field sample to show a documentation method - not to claim a complete neighborhood inventory or a municipal role.

> **San Diego Palm Protection submitted mature-palm documentation for consideration during the City of Escondido Urban Forest Management Plan process.**

What this example can demonstrate

Location context General area and property context can be recorded without publishing a private address.	**Photographic baseline** Dated or source-retained photographs can preserve visible crown, trunk, and site context.
Repeat observations A consistent record structure helps compare visible change across visits.	**Loss and response** Removal, replacement, contractor records, and follow-up can be linked to the same palm record.
Implementation value Portfolio or neighborhood summaries can support monitoring and planning decisions.	**Escalation boundaries** Records can flag questions for a qualified arborist, laboratory, property authority, or other specialist.

Municipal boundary: Submission for consideration does not imply endorsement, partnership, selection, approval, adoption, contract, or an official City role.

A REPEATABLE FIELD STRUCTURE

Documentation Method

1. Identify	Assign a stable palm or group identifier; record only the location precision appropriate to the audience.
2. Photograph	Capture crown, trunk, base, surrounding context, and a repeatable viewpoint when access and safety allow.
3. Observe	Describe visible conditions without turning an observation into an unsupported diagnosis.
4. Classify next action	Continue monitoring, obtain supporting records, request specialist review, coordinate response, or document loss.
5. Preserve chronology	Keep dates, supplied work records, follow-up images, and limitations connected to the same record.

Example record fields

• Public-safe record ID	• General location or management zone
• Palm type and visible context	• Observation date or date withheld publicly
• Photo viewpoint	• Visible crown and trunk observations
• Reported or supplied history	• Monitoring priority
• Recommended next action	• Limitations and referral notes

OLD ESCONDIDO AREA CONTEXT

Representative Field Records

The following examples retain general context while withholding private-property addresses. Captions report what is visible or what the source record supports; they do not assign ownership, historic designation, or pest diagnosis.

Public example record OE-01. General Old Escondido neighborhood context. Multiple mature Canary Island date palms are visible within one streetscape view. Exact location and capture date are withheld in this public derivative.

Public example record OE-02. Mature Canary Island date palms and an older-looking residence read as one established landscape composition. No construction year, ownership, or historic designation is assigned.

Observation boundary: A photograph can document visible form, crown condition, and setting. It cannot by itself confirm internal condition, structural safety, pest presence, treatment history, ownership, or legal status.

FROM ONE IMAGE TO A CHRONOLOGY

Baseline and Monitoring Value

Public example record OE-03. Owner-approved November 2025 photographic baseline of a mature private-property Canary Island date palm. Address and identifying property details are omitted.

Baseline	Retain dated crown, trunk, and site-context views using a repeatable position.
Follow-up	Compare visible change while recording weather, access, and image-quality limitations.
Work record	Link supplied scope, service date, contractor identity, and before/after photographs when available.
Escalation	Flag rapid change, uncertainty, or questions outside the visual documentation scope.

A stable record makes change reviewable

Repeat monitoring is useful because a single image is easy to overread. When viewpoints, dates, observations, and limitations stay connected, an owner or stakeholder can distinguish a documented change from a difference in angle, light, access, or image quality.

Monitoring records can also preserve what was recommended, what work was reported or supplied, and when escalation was advised. They do not certify concealed work, workmanship, safety, code compliance, licensing, efficacy, or outcome outside an explicit qualified scope.

KEEP OUTCOMES CONNECTED TO THE BASELINE

Decline, Loss, and Response Records

Public example record OE-04. Las Palmas crown context photographed before removal. The image records visible crown change without asserting a laboratory diagnosis or a single confirmed cause.

A decline or loss record may include

- the last known baseline and follow-up photographs
- visible changes and the dates retained in the source record
- communication or access milestones, summarized without private correspondence
- supplied contractor scope and visible completion photographs
- removal status and remaining site context
- replacement planning, establishment monitoring, or referral

Cause boundary: Visible decline is not a laboratory diagnosis. A public record should distinguish observed conditions from reported history, possible causes, presumed attribution, and confirmed findings.

Why this matters: When a significant palm is removed, the record can preserve what was visible beforehand, what response occurred, and what landscape condition remained. That chronology supports accountable follow-through without claiming a guaranteed preservation or replacement outcome.

MANAGED-PROPERTY AND URBAN-FOREST SUPPORT

Implementation Uses

Inventory maintenance	Keep stable palm identifiers, location context, species or type, photographs, and status fields current.
Monitoring	Schedule repeat observations and preserve a reviewable chronology of visible change.
Contractor verification	Document visible completion and supplied records within stated scope and limitations.
Removal and replacement	Connect decline, removal, replacement selection, installation, and establishment follow-up.
Historic-resource context	Preserve mature-palm landscape context without assigning an unsupported designation.
Portfolio summaries	Group records by property, zone, or priority without exposing private details in public examples.

Example action categories

Monitor Retain baseline and repeat on an appropriate schedule.	**Clarify** Obtain supplied history, access, or supporting records.	**Escalate** Refer a question beyond visual field documentation.	**Respond** Coordinate documented work, removal, or replacement follow-through.

PUBLIC EXAMPLE BOUNDARIES

Limitations and Next Steps

- Visual field observations only; hidden conditions may not be visible.
- Not a complete Old Escondido inventory or full Urban Forest Management Plan.
- Not a formal tree-risk assessment, engineering opinion, municipal-code determination, or laboratory confirmation.
- No City endorsement, partnership, selection, approval, adoption, contract, or official role is implied.
- No guarantee of treatment success, preservation, safety, contractor performance, or replacement outcome.
- Exact private-property addresses, identities, correspondence, and parcel-level details are intentionally omitted.
